

Bethune Energy

Property Value Impact Assessment Summary

Executive Summary

Bethune Energy is a proposed approximately 500 MW natural gas fueled electricity generating facility near the Town of Bethune in Kershaw County, South Carolina (the “Project”). Beaufort Rosemary retained Integra Realty Resources–Columbia (“IRR”) to evaluate whether proximity to a power plant adversely affects the value of adjoining residential properties. The study, dated September 13, 2026, examined residential sales near four existing power plant locations in South Carolina and North Carolina.

IRR compared homes adjoining or near power plant properties with homes farther from those facilities. In each comparison, the home nearer the plant sold for a similar or higher price per square foot of heated living area than the comparison home, after adjusting the comparison sale for its sale date. The findings provide market evidence relevant to the Project’s potential effect on nearby residential values.

Based on this analysis using the sales analyzed, IRR concluded that the market data revealed no measurable adverse impact on residential property values for homes abutting a gas fired power plant facility.

Sales Reviewed and Methodology

The study evaluated 12 residential sales across four plant locations, comprising five homes adjoining or near plant properties and seven comparison homes. Sales occurred between December 2023 and April 2026. IRR selected comparisons based on similar sale timeframes and physical characteristics, including home age, quality, and size.

The analysis compared sale prices per square foot of heated living area. Comparison sales were adjusted to the date of the corresponding nearby home’s sale using an annual market appreciation rate of 3%.

Plant location	Properties evaluated	Price per heated square foot
Hagood Station North Charleston, SC	Two homes in Rosemont, the subdivision adjoining the plant, compared with three homes in Union Heights across an interstate.	Nearby: \$244.28 and \$327.73 Comparisons: \$226.93, and \$302.27–\$309.18, respectively.
Columbia Energy Center Gaston, SC	One home in Plantation Estates near the plant, compared with one home in Heather Hills across an interstate.	Nearby: \$158.51 Comparison: \$123.27
Winyah Generating Station Georgetown, SC	One home in Pennyroyal, the subdivision adjoining the plant property, compared with one home in Kensington across a U.S. highway.	Nearby: \$153.75 Comparison: \$126.59
Lincoln Combustion Turbine Station Stanley, NC	One home directly across the street from the plant property, compared with two homes in separate subdivisions farther from the facility.	Nearby: \$173.33 Comparisons: \$136.85–\$168.06

Comparison-home figures include the report’s sale-date adjustments. The report identifies Winyah as an operating coal-fired facility with a planned transition to gas or fuel oil; it therefore represents a different generating technology from the proposed Project.

Scope and Conditions

The findings reflect the residential sales evaluated and are subject to the assumptions and limiting conditions in the full report. The analysis uses a limited sample of transactions near existing facilities and does not predict the future sale price of any individual property. IRR's conclusion assumes that the Project is developed and operated as described, including implementation of planned mitigation measures and compliance with applicable operating requirements.

Appraiser Qualifications and Certification

The study was prepared by M. Kyle Winters, MAI, ASA, a South Carolina Certified General Real Estate Appraiser with Integra Realty Resources—Columbia. In the report's signed certification, the appraiser states that he personally inspected the Project property, has experience appraising similar properties, and has no present or prospective interest in the property or personal interest in the parties involved. He further certifies that the analysis and conclusions are impartial and unbiased, that neither the engagement nor his compensation was contingent on a predetermined result, and that the report was prepared in conformity with the Uniform Standards of Professional Appraisal Practice and applicable professional and state appraisal requirements.

Disclaimer

This summary is prepared solely for general informational disclosure regarding the proposed Bethune Energy facility. It does not constitute a full appraisal report, real estate advice, or an appraisal of any individual parcel. Neither Integra Realty Resources—Columbia nor the Project developer authorizes members of the public, adjoining landowners, buyers, or lenders to rely on these findings for individual property valuation, tax, or investment decisions. Market conditions reflect the effective date of the analysis (August 23, 2026). The complete appraisal report contains essential context, market definitions, extraordinary assumptions, and limiting conditions that are omitted from this high-level summary.
